

COOPERATIVE ECONOMIC INSECT SURVEY REPORT  
Glenn A. Salsbury, Survey Entomologist

Report 4, Volume 58  
June 2, 2010

LITTLE CARPENTERWORM MOTH (*Prionoxystus macmurtrei*): One female recently caught in a light trap set two miles south of Galena, Kansas. This is believed to be the first record for the state.

XYLEBORUS VOLVULUS: Probably this species. One specimen was taken in a canopy trap between 2-16 September 2009 in Cherokee County Kansas about two miles south of Galena. This is a considerable range extension as it was previously known, in the continental United States, from Florida. The host for this species, in Kansas, is not known. My thanks to Bob Rabaglia for the identification of this beetle.

MIMOSA WEBWORM: One moth caught on 31 May in Frontenac, Kansas.

CEREAL LEAF BEETLE: None have been found in surveys.

GREEN JUNE BEETLE: Adults are now flying.

REDHEADED ASH BORER: Numerous adults are being caught in canopy traps.

EMERALD ASH BORER: None found in traps checked so far.

JAPANESE BEETLE: Adults should be flying soon.

WALNUT TWIG BEETLE: None have been detected in the state.

No pests were found in one corn field surveyed in Miami County.
